

Module 1:

- One team member will assume the role of Product Owner representing the client, while the other team member assumes the UI designer/web developer role. In a team of three, the 3rd person will assume a Co-Product Owner role representing the Marketing function for the client.
- Using the Pets-R-Us scenario as a reference, the developer must interview the Product Owner(s) to elicit and document a detailed list of three (3) or more user requirements in the form of user stories. The stories must be written in standard story format (As an x, I need y, so that z). NOTE: Requirement Elicitation Questions from the Reading & Videos section may help with the interview process.
- The Product Owner(s) and developers should then switch roles so that everyone has a chance to serve in the developer role. NOTE: Two-person groups should generate six (6) or more user stories, while three-person groups would end up with 9 or more user stories.
- The stories should then be ranked in priority order from 1 to n, with 1 being the highest priority.

UI Designer/Web Developer:	What is your current customer base composed of? -Ashley	Ranking:
Product Owner:	As the Product Owner, I need the website to collect and categorize user behavior (such as browsing adoptions, shopping for supplies, or booking services), so that we can better understand the composition of our customer base and tailor our offerings and marketing strategies accordingly. -Wade	5
Co-Product Owner		

UI Designer/Web Developer	How would you like to receive the backend information (such as the bookings and client information)? -Ashley	Ranking:
Product Owner:	As the Product Owner, I need every new appointment and customer record to be transmitted in real time through a secure REST API into our existing point-of-sale and CRM platforms, so that staff can manage schedules and communications in one place without duplicating data entry. -Wade	1

Co-Product Owner		
------------------	--	--

UI Designer/Web Developer	How should information about the client be saved? Account system or entered manually? -Ashley	Ranking:
Product Owner:	As the Product Owner, I need customer information to be saved through a secure account system, so that returning clients can log in easily, access their past appointments, and avoid re-entering their contact and pet details each time they book a service. -Wade	2
Co-Product Owner		

UI Designer/Web Developer	What specific information should customers see or choose when booking a grooming, training, or boarding appointment (service types, time slots, pet details)? -Wade	Ranking:
Product Owner:	As the Product Owner, I'd like the customers to have full flexibility when booking their appointments, offering options such as specific stylists for grooming or a trainer. -Ashley	3
Co-Product Owner		

UI Designer/Web Developer	Do you want customers to receive any kind of confirmation or reminders after booking an appointment, and if so, how should those be delivered (email, text, in-app notifications)? -Wade	Ranking:
Product Owner:	As the product owner, it is important that the customers are informed and reminded, especially if there are fees for late/missed appointments. It's important that the customer gets an email and text notification! -Ashley	4
Co-Product Owner		

UI Designer/Web Developer	Are there any design or branding preferences we should follow to ensure the website reflects the personality and values of Pets-R-Us (colors, imagery, tone of language)? -Wade	Ranking:
---------------------------	--	-----------------

Product Owner:	As the product owner, Pets-R-Us has a very playful vibe that I'd like carried over. -Ashley	6
Co-Product Owner		

Module 2:

- Using the ranked stories from Group Activity #1, break the top two stories down into at least five (5) tasks within each story.
- With all team members serving in a designer/developer role, work together to estimate the size of each task and the overall story in hours and in points. Do this for both of the top two stories from your prioritized list.
 - Use the Planning Poker video as a reference for the points-based estimation process.
 - The online Planning Poker game facilitates the sizing process when teams are remotely located.

Wade:

As the Product Owner, I need every new appointment and customer record to be transmitted in real time through a secure REST API into our existing point-of-sale and CRM platforms, so that staff can manage schedules and communications in one place without duplicating data entry.	Hours: 27	Points 21
Task 1: Design API request/response structure for appointment and customer data. • Define data schema: fields like customer name, pet details, appointment time, and service type. • Confirm with stakeholders what fields are required for both POS and CRM integration.	5	3
Task 2: Build and test REST API endpoints for transmitting appointment and customer data. • Develop backend API functionality to POST data securely. • Include input validation and error handling.	6	5
Task 3: Authenticate and secure the API connection with encryption/token-based security. • Implement token-based authentication (OAuth 2.0 or API key). • Handle token refresh or expiration logic if needed.	5	3
Task 4: Integrate with existing POS and CRM systems. • Map API fields to corresponding POS and CRM database fields • Validate successful transmission and log failures	8	8
Task 5: Create a monitoring, logging, and error notification system. • Log all API activity with timestamps and status. • Send alerts if transmission fails or data mismatches occur. • A dashboard or admin panel for viewing sync history (optional but useful).	3	2

Ashley:

As the Product Owner, I need customer information to be saved through a secure account system, so that returning clients can log in easily, access their past appointments, and avoid re-entering their contact and pet details each time they book a service.	Hours: 15	Points 10
Account button present on every screen as the user navigates the website, perhaps in the design of a dog or pawprint instead of a human silhouette	3	1
The past appointment button from the main account homepage. The button would also offer an easy “rebook” feature, allowing the customer to just select a date.	5	3
The upcoming page, detailing appointments coming up.	2	2
Pet page - a profile created for each individual dog the customer has. The customer can update with things like pet allergies, breed, age, etc. This would also allow Pets-R-Us to send any emails for things such as birthdays!	3	2
Log out button - crucial for anyone who perhaps logs in and out on public computers!	2	2

Module 3:

- Identify and agree on specific functionality within the Pets-R-Us site to use for this exercise.
- Using requirements details learned from elicitation activities, each team member should create a wireframe design for the selected functionality (can be paper/pencil).
- The team should review and exchange wireframes, and compare notes.
- Are there additional changes or adjustments that should be made to the final wireframe product now that these visualizations are available? Make any necessary refinements and agree upon the final version of the wireframe to represent the team. Any drawing tool may be used, as long as the result can be included in the final document.
- Document any challenges the team faced or any lessons learned during each group activity.

© 2025 Pets-R-Us | 123 Pet Lane, Denver, CO | (720) 555-1234

As listed above

Functionality Selected:

We chose to wireframe the *Customer Appointment Booking* feature, which is central to Pets-R-Us's service expansion. This wireframe provides a clean, step-by-step layout for users to select services, dates, pets, and preferences in a user-friendly flow.

Wade, I REALLY like your wireframe! - Ashley

Challenges and Lessons Learned:

One challenge was not having consistent collaboration across all group members. Better communication and time management would've helped maintain involvement from everyone. A

key lesson learned is that clear user stories directly shape how we visualize and design user-friendly interfaces. Next time, I'd recommend setting group deadlines and using shared tools to check in weekly.

We had an issue with our team where Wade and I were communicating fairly frequently. We heard nothing the entire week from our other two team members, so we operated as a duo. I did attempt emails, but it wasn't working and kept throwing errors at me. I wish we had more time on the project and a more reliable method of communication. If I hadn't seen the group project and gone about my normal schedule, it wouldn't have started until the weekend. I needed more time to account for working with multiple others.
